Done: Discussion on netease project. I sent the email to enquire about the data we need, and discuss with Wison and partners via internet or oral communication. We define six analysis questions/tasks, and refine them to more detailed questions. Details can be seen from E-mails.

- the distributions of goods purchase in online mall of QNYH.
- dynamics of networks
- dynamic correlations between the two items above
- from overview to detail view (in designing the views)
- contrast and comparison
- prediction, “what if” questions

We intended to make a regression on cumulative investment in the game along online time. However, after we plot the data, we find it difficult to compute the regression, even though we do log on the u-axis.

Ke wrote some words in Chinese for the survey. Li made the bib information. I will combine their work soon, and start writing the third part of the paper this week.

We had a interview with the candidate of our netease project and select 2. On operating system course, our group also did a presentation.

Some reflections and notes on TEDxSF: How to stop screwing yourself over:

- Don't say fine.(不能有得过且过的心态)
- You will NEVER feel like doing what is needed to be done to achieve what you want. So, FORCE yourself
- If you feel stuck, it's a signal that one of your most basic needs are not being met. Adventure yourself.
- Your problem is not idea, it is your inaction. If you want to do something with an idea, do it within next five seconds(example- write it down, text it etc) If you don't, your idea will die in next 5 seconds.

To do:

1. Perfect the details of the parts of the survey which have been written.
2. Think about the design of the six questions.
3. Visit netease company, discussed about the data we need, the questions we raised(are they useful for company?)
